Paper Title Evidence-Calibrated Open-Vocabulary Discovery of Emerging Semantic Shifts in Longitudinal Text Streams

Reviewer #1

Questions

1. Is the abstract in summarizing the paper's objectives, methodology, and conclusions?
Yes

4. Please provide your overall comments on the paper, including strengths, weaknesses, and specific suggestions for improvement.
The paper proposes ECOS, an open-vocabulary semantic-shift discovery pipeline combining contextual evidence, sense distributions, and metadata-matched counterfactual verification. The reported MAP improvement from 0.48 to 0.73 on SEM-STREAM is encouraging. However, the authors should explain candidate-generation weights, metadata matching, confidence calibration, and acceptance thresholds in greater detail. Repeated-run variability, statistical significance, and evaluation across additional domains are needed to establish generalizability.The author is suggested to strictly use springer template.

5. Decission on the paper
Marginal Acceptance

Questions

1. Is the abstract in summarizing the paper's objectives, methodology, and conclusions?
Yes

4. Please provide your overall comments on the paper, including strengths, weaknesses, and specific suggestions for improvement.
Treating candidate semantic shifts as hypotheses and validating them through counterfactual matching is a promising contribution. However, performance on LiverpoolFC remains weaker than the strongest baseline, requiring further analysis. The authors should distinguish the proposed ECSS scoring procedure from existing contextual and temporal signals. Clearer ablation results, uncertainty estimates, updated references, and improved notation would strengthen the manuscript.The author is suggested to strictly use springer template.
